-peter-stokeley 2012 Illustration of the graphs of $f(x)=\sqrt{(x+1)(x+2)}$, the infinite sequence of positive square roots of the consecutive powers of the arithmetic sequence of positive integers 1, 2, 3,... with $x+1$ at the first term and xn at the n th term. Thus, there are no negative terms and the domain of x is the positive real numbers. In this context, we use the term coordinate axis to refer to the line of x -axis and the line of y -axis and say that the origin of the coordinate system is placed at the point $(0,0)$. The points of the Cartesian coordinate system are written in the form (x,y) with x and y real numbers. The standard axis is the positive x -axis. We say that we take a Cartesian coordinate system and place it at the origin of the coordinate system, the coordinate $(0,0)$. If (x,y) is a point, then the point $(x-1,y-1)$ is called the first Cartesian neighbor of the point (x,y) . If (x,y) is the starting point, then the points $(x+1,y)$ and $(x,y+1)$ are called the second and third Cartesian neighbors of the point (x,y) . The points $(x+2,y)$, $(x+3,y)$, and so on, are called the n th Cartesian neighbors of the point (x,y) . The set of numbers $\mathbb{P}=\mathbb{N}$ is the set of all integers greater than or equal to 0, and the set of real numbers \mathbb{R} is the set of all real numbers. In a similar way, the sets of integers \mathbb{S} and rational numbers \mathbb{R} and their Cartesian product $\mathbb{R}\times\mathbb{R}$ are the sets of the integers greater than or equal to 0 and the real numbers, respectively. A geometric figure is any object that can be mathematically represented in two dimensions. Of particular interest to us here are the plane, the rectangular solid, and the circle. In addition to their intrinsic geometrical significance, mathematical concepts of geometry also have intrinsic practical values in number-crunching areas such as mathematics education, mathematics teaching and instruction, engineering, computer science, data analysis, and several other areas of research and practice. Mathematics is the study of patterns and relationships of mathematical objects, their properties, and the ways in which those objects interact 82157476af
